# LUMI - Project Milestone 3

12<sup>th</sup> October 2021

## FEATURES COMPLETED:

1. Working Front-end website with 3 different pages
2. Login / Registration page is usable
3. Page layouts have been completed

## WHAT WORKED:

1. The navbar to change to different pages worked
2. Login and registration page has worked (must be email and contains a password)

## ISSUES:

1. Missing CSS for some pages
2. Inconsistent color-schema for all the pages
3. Haven't integrate back-end and database
4. Missing algorithm to recommend users

## SUGGESTIONS:

1. Create a css stylesheet that will be consistently used throughout the website
2. Start testing API calls to website and see if it changes
3. Begin developing database format for the website data
4. Begin developing algorithm to recommend snowboarders

## INDIVIDUAL CONTRIBUTIONS

**Altay Uenal** → Researched API's to use for weather and maps and read through their documentation

**Biswas Gauli** → Researched on API documentation and how to apply API information onto the website

**Freddy Perez** → Created a responsive landing page for website with working navbar, buttons, and information layout

**William Ruiz** → Front end of the Login/Registration page, has a working modal pop-up for registration. Need to incorporate a database now and password checking in order to complete the signup process and login.

**Thor Breece** → Front end of About Us page, workshopped different color schemes that I will later apply to the entire website.

**Rayner Susanto** → Created database table and design for the website profiles and weather forecast. Researching on how to integrate the database into the website using NodeJs
